

SUPPLEMENTARY FIGURE

Supplementary Figure 1. LiCl treatment activated Wnt/ β -catenin signaling in U87 and SHG139 cells. The protein expression levels of active β -catenin in (A) U87 and (B) SHG139 cells after LiCl or vehicle treatment were determined by western blotting assay. The TOP-FLASH activity in (C) U87 and (D) SHG139 cells after LiCl or vehicle treatment were determined by TOP-FLASH assay. Significant differences compared to control group were expressed as * $P < 0.05$.
